

# BIOF 087: Programming for Biomedical Researchers

Computer programs are meant to perform repeated, monotonous, fast, reproducible tasks, handling any amount of data. Researchers often come across situations where existing programs don't suit their needs. In the era of BigData, without the ability to quickly put together a program that would solve their problem, researchers face a road block that is not efficiently solvable by a human. This training will walk through participants in writing programs that would help them solve their own problems.

**Credits:** 3

**Class Type:** Workshop

**Program:** Bioinformatics and Data Science

**Availability** Currently Not Available
